Abstract: The report estimates the economic impacts on industries, localities, and occupational groups from reduced DoD purchases of goods and services between 1991 and 1997. The report focuses on gross changes rather than net effects. Gross changes in DoD's demand for goods and services and in defense-related jobs are those that result directly from changes in defense spending. The primary basis for the analysis is output obtained from the Defense Economic Impact Modeling System (DEIMS).

Executive Summary

During the nearly four decades of the Cold War, national defense consumed a significant portion of the country's economic resources. Although defense spending as a percentage of Gross Domestic Product (GDP) varied over that period, its share of GDP was never less than 4.8 percent (in 1978 under President Carter) nor more than 14.5 percent (in 1953 under President Eisenhower). At the last cyclical peak, the defense budget consumed 6.5 percent of GDP (in 1986 under President Reagan). Because of major changes in the geopolitical environment and pressing social and economic needs in the United States, the American political system decided to shift resources away from national defense. By 1997, the DoD budget is expected to fall to 3.6 percent of GDP, the lowest level of defense spending relative to national income since the end of World War II.

DoD budgets consist of two principal types of expenditures: those that pay active duty military, selected reserve military, DoD civilian workers, and retirees; and those that purchase goods and services from the private sector. We analyze how DoD purchases impact the private sector and estimate the economic effects of reduced defense spending for goods and services. We use a broad definition of defense industries and workers that includes all defense prime contractors, their major subcontractors, and other private-sector suppliers to defense producers. Using various data and analytical tools, the economic impacts of DoD purchases of goods and services are considered at the industry, state, county, and occupational levels. While the overall effects of defense downsizing at the national level are minimal, some industries, states, counties, and occupations are substantially dependent upon DoD purchases and will experience severe negative impacts between 1991 and 1997.

DoD buys more from the manufacturing sector than from any other sector. According to results from the Defense Economic Impact Modeling System (DEIMS), 61.2 percent of DoD's direct and indirect purchases in 1991 were from the manufacturing sector and 17.6 percent were from the service sector. The most heavily defense-dependent industries produce specialized military end items. For example, the DEIMS model estimates that DoD essentially purchases 100 percent of the missiles, tanks, and ordnance; 50 percent of the ships, boats, and railroad equipment; 50 percent of the communication and search and navigation equipment; and 34 percent of the aircraft, aircraft engines and parts, and missile engines and parts produced. The DEIMS model projects that these four industry groupings will suffer the largest

reductions in their business bases between 1991 and 1997 as a result of defense downsizing; the projected business base declines in those specialized groupings are 36, 23, 21, and 11 percent, respectively.

The DEIMS model estimates that there were 3.2 million private-sector defense-related jobs in 1991. This figure implies that approximately 3.4 percent of all workers on private-sector payrolls produced goods and services for DoD, either directly or indirectly. Private-sector defense-related jobs are projected to decline to 2.3 million by 1997. This decline is 1.0 percent of private-sector payroll employment and, on an annual basis, averages less than 0.2 percent per year. According to DEIMS, most private-sector defense-related jobs are in the manufacturing sector. The second largest concentration of defense-related jobs is in services. In terms of the absolute magnitude of defense-related jobs lost, manufacturing leads with 621,000, and services is second with 143,000 jobs lost. Defense-related jobs as a percentage of total private-sector employment are greatest in manufacturing (8.7 percent) and second largest for mining (5.8 percent). The projected decline in defense-related jobs as a percentage of private-sector employment is greatest in manufacturing (3.2 percent) and second largest for mining (1.9 percent).

According to the DEIMS model, DoD purchases are highly concentrated in a small number of states. For example, 59.0 percent of DoD's direct and indirect purchases and 59.4 percent of private-sector defense-related jobs are concentrated in 10 states: California (accounting for 18.5 percent of DoD's purchases and 18.0 percent of private-sector defense-related jobs), Texas (6.6 and 6.2 percent), New York (6.3 and 6.7 percent), Massachusetts (4.7 and 4.9 percent), Virginia (4.5 and 5.1 percent), Ohio (4.2 and 3.9 percent), Florida (3.9 and 4.1 percent), Pennsylvania (3.8 and 3.8 percent), Connecticut (3.4 and 3.5 percent), and New Jersey (3.0 and 3.2 percent). Six states are dependent upon defense-related jobs for more than 5 percent of their nonfarm private-sector payroll employment: Connecticut (8.3 percent), Virginia (7.4 percent), Massachusetts (6.5 percent), California (5.6 percent), Maryland (5.5 percent), and Mississippi (5.2 percent). We project that only five states will lose more than 1.5 percent of their nonfarm private-sector payroll employment as a result of defense-related job losses: Connecticut (2.8 percent), Virginia (2.1 percent), Massachusetts (1.9 percent), Mississippi (1.8 percent), and California (1.7 percent).

To identify the impact of DoD purchases at the county level, we used the Defense Contract Action Data System (i.e., the DD Form 350 data base). We discovered that the top 20 counties accounted for 43 percent of the defense prime contracts valued over \$25,000 that were awarded

domestically in 1991. California was heavily represented with 4 of the top 20 counties. Other states with a large number of heavily defense-dependent counties include Connecticut with three counties; and Texas, Massachusetts, and Arizona with two counties each.

Using industry-occupation coefficients derived from the Bureau of Labor Statistics' National Occupational Employment Statistics for 1990, we estimated the composition of the private-sector defense work force in 1991 and the occupational distribution of defense-related jobs likely to be lost between 1991 and 1997. We find that most private-sector defense-related jobs are in the "Professional specialty" category (605,000 jobs). The second largest concentration is in "Precision production" (597,000 jobs). In terms of the absolute magnitude of defense-related jobs lost, "Precision production" leads with 193,000 jobs lost, and "Professional specialty" is second with 177,000 jobs lost. Defense-related jobs as a percentage of private-sector payroll employment are greatest for "Technicians/support" (6.0 percent) and second largest for "Precision production" (5.4 percent) personnel. The projected decline in defense-related jobs as a percentage of private-sector payroll employment is greatest for "Technicians/support" (1.9 percent) and second largest for "Precision production" (1.8 percent) personnel.

CHAPTER 1

Introduction and Summary of Major Findings

INTRODUCTION

This report estimates the economic impacts on industries, localities, and occupational groups from reduced DoD purchases of goods and services between 1991 and 1997. We broadly define defense industries and workers to encompass all defense prime contractors, their major subcontractors, and other private-sector suppliers to defense producers. This definition captures all direct and indirect effects of DoD purchases from the private sector. We refer to jobs in the private sector that are generated by DoD purchases as "defense-related" to distinguish them from DoD civilian and uniformed military employees.¹

This report focuses on gross changes rather than net effects. Gross changes in DoD's demand for goods and services and in defense-related jobs are those that result directly from changes in defense spending. Gross changes do not include "induced" changes resulting from further rounds of decreased spending (i.e., multiplier effects), nor do they include any salutary effects (e.g., lower interest rates) caused by decreased defense spending. Depending upon the assumptions made and the time frame considered, the net effects of reduced defense spending may be larger or smaller than gross changes.

The primary basis for this analysis is output obtained from the Defense Economic Impact Modeling System (DEIMS). Based upon a request from the Chairman of the Defense Conversion Commission, DoD's Office of Program Analysis and Evaluation (PA&E) provided the complete data that underlie their most recently published DEIMS

¹Annex H to the report of the Defense Conversion Commission, *Adjusting to the Drawdown*, explicitly considers the impacts of DoD employment, purchases, and induced effects upon local economies.

report.² That report was based upon the President's February 1991 budget submission; it did *not* include the effects of Operations Desert Shield and Desert Storm. The President's February 1991 budget submission contained a projection for 1997 defense spending in the Future Years Defense Program. The data in the DEIMS report were on the basis of *calendar years* (CY) (as opposed to the more commonly used fiscal year). It is also important to note that defense outlays in any given year partially reflect budget authority from several prior years. During buildups and builddowns, defense outlays tend to lag budget authority. Finally, because defense budget authority for FY93 to FY97 was reduced 3 percent in the President's January 1992 budget submission and may be further reduced by Congress as FY97 approaches, the 1991 DEIMS estimates probably *understate* the decline in defense spending that is likely to occur between 1991 and 1997.

MAJOR FINDINGS

DoD buys more from the manufacturing sector than from any other sector. For example, 61.2 percent of DoD's direct and indirect purchases and 51.1 percent of defense-related jobs are concentrated in the manufacturing sector (see Table 1-1). In comparison, 20.3 percent of all private-sector "payroll" employment in 1990 was in manufacturing.³ While DoD spending accounts for 3.4 percent of private-sector payroll employment, DoD generates 8.7 percent of the jobs in the manufacturing sector. Of 65 industry groupings into which DEIMS subdivides the private-sector economy, 9 are dependent upon DoD for more than 10 percent of their employment (see Table 1-2). Only 7 industry groupings will lose more than 5 percent of their employment because of defense downsizing. All of the most defense-dependent and heavily impacted industries are in the manufacturing sector.

Similarly, most DoD purchases from the private sector and the associated employment are concentrated in a handful of states.

²Washington Headquarters Services, Directorate of Information Operations and Reports, *Projected Defense Purchases, Detail by Industry and State: Calendar Years 1991 through 1997*, U.S. Government Printing Office, Washington, D.C., November 1991.

³Max L. Carey and James C. Franklin, "Industry output and job growth continues slow into next century," *Outlook: 1990-2005* [Bureau of Labor Statistics (BLS) Bulletin 2402], May 1992, p. 44. To estimate private-sector "payroll" employment, governmental employment was subtracted from and agricultural employment was added to nonfarm wage and salary employment. Private household workers, nonagricultural self-employed, and unpaid family workers were not included.

^a Apparent overestimate by DEIMS.

Fifty-nine percent of DoD's direct and indirect purchases and 59.4 percent of defense-related jobs are concentrated in 10 states (see Table 1-3). Of 51 states (Washington, D.C. is included), 6 states are dependent upon DoD purchases for between 5 and 8.3 percent of their nonfarm private-sector payroll employment (see Table 1-4). Only 5 states will lose more than 1.5 percent of their nonfarm private-sector payroll employment because of defense downsizing.

Defense purchases are concentrated in relatively few counties. For example, the top 20 counties received 43.5 percent of the defense prime contracts valued over \$25,000 that were awarded in 1991 (see Table 1-5).

TABLE 1-5
Top 20 Counties Receiving the Largest Dollar Value of Prime Contract Awards in FY91

County	State	Value of awards (1993 \$ billions)	Cumulative percentage of total awards
Los Angeles	California	10.6	8.2
St. Louis (city)	Missouri	5.7	12.6
Tarrant	Texas	4.0	15.7
Santa Clara	California	3.8	18.6

Hartford	Connecticut	1.1	43.5

Source: Logistics Management Institute (LMI) analysis of the Defense Contract Action Data System (DD Form 350 data base).

Finally, we find that three of nine major occupational groupings are dependent upon DoD purchases of goods and services for between 5 and 6 percent of their private-sector payroll employment (see Table 1-6). We estimate that only three occupations (technicians and related support, precision production, and professional speciality – which includes engineers and scientists) will suffer more than a 1.5 percent reduction in jobs as a result of defense downsizing between 1991 and 1997.

TABLE 1-6
Occupational Dependence and Impact

Occupational grouping	Defense-related employment as a share of private-sector payroll employment (percent)	Rank	Reduction in defense-related employment between 1991 and 1997 relative to private-sector payroll employment (percent)	Rank
Technicians and related support	6.0	1	-1.9	1
Precision production	5.4	2	-1.8	2
Professional specialty	5.1	3	-1.5	3
Executive, administrative, and managerial	4.2	4	-1.3	4
Operators, fabricators, and laborers	3.3	5	-1.1	5
Administrative support including clerical	3.2	6	-0.9	6

GUIDE TO REPORT CONTENTS

In the balance of the report, we show the impact of DoD purchases on industries, associated employment, and the projected decline in defense-related employment between 1991 and 1997. Chapter 2 analyzes industry impacts. Chapter 3 discusses the impact of defense expenditures on states and Chapter 4 discusses that impact on counties. Finally, in Chapter 5 we explore the impact of DoD's purchases and the projected defense spending decline on various occupations.

CHAPTER 2

Industry Analysis

METHODOLOGY

The DEIMS is an analytical tool that was developed by the Economic Analysis and Resource Planning Division of the OSD's Office of PA&E. The objective of DEIMS is to estimate the impacts of defense spending on industries, employment, and states. Ironically, it grew out of a concern during the early 1980s that rapidly increasing defense expenditures would create bottlenecks as capacity was reached in certain sectors thereby fueling inflation and/or creating shortages.

The DEIMS translator module converts budget authority into fund outlays (DoD "direct" purchases) and distributes those outlays to industries. An input-output module then estimates the economy-wide production of goods and services required to support defense spending (i.e., DoD total purchases). The differences between total and direct purchases are classified as DoD "indirect" purchases. The distinction between direct and indirect DoD purchases is significant. For example, DoD buys a large quantity of products from the shipbuilding and aircraft industries directly, but purchases comparatively little from those industries indirectly. Conversely, although DoD buys very little steel and few semiconductors directly, it buys a large quantity of them indirectly since they are embodied in defense major end items such as ships and aircraft.

The DEIMS has two other components. The labor forecasting module of DEIMS (LDEIMS) estimates employment generated through DoD's direct and indirect purchases. One shortcoming of an input-output methodology like the one used by DEIMS is that double counting inevitably occurs. This problem arises because shipments of subcomponents such as landing gear and jet engines that are counted in indirect purchases are also included in the direct purchases of aircraft. To overcome double counting, LDEIMS estimates domestic defense-related employment by dividing DoD total purchases (after first netting out imports) by shipments per worker. The Regional DEIMS (RDEIMS) module distributes DoD's direct and indirect purchases and the associated employment to the state level. The Defense Contract Action

Data System (DD Form 350 data base) is the primary basis for allocating DoD direct demand to the states. Indirect defense expenditures are distributed among the states on the basis of state shares of total employment in each of the sectors.¹

DEFENSE PURCHASES IN 1991

The DoD's private-sector spending is concentrated in a relatively small number of industries (Table 2-1). Of a total of 426 private-sector industries defined by the DEIMS, 101 account for 90 percent of DoD's direct and indirect purchases. The second largest DEIMS category entitled "Other business services, NEC" consists of services for dwellings and buildings, miscellaneous repair shops, detective services, photography labs, photocopying, photography, and other business services. Some other DEIMS categories that represent a significant proportion of DoD purchases but are not commonly considered defense industries per se include wholesale trade, real estate operators, eating and drinking places, and banking. The essential point, captured so elegantly by DEIMS, is that a dollar's worth of a B-1 bomber includes not only the airframe, landing gear, and avionics, but also indirect expenses such as building rents and maintenance, electric utilities, business travel, communications, banking, and insurance services.

¹More detailed information on the DEIMS methodology can be obtained from *Defense Purchases: An Introduction to DEIMS*, *Defense-Related Employment of Skilled Labor: An Introduction to LDEIMS*, and *State-Level Projections of Potential Defense Outlays: An Introduction to RDEIMS*. Copies of these documents may be obtained from the Office of Industrial Base Assessment, Two Skyline Place, Suite 1406, 5203 Leesburg Pike, Falls Church, Virginia, 22041-3466.

^a We modified some DEIMS titles to better describe the industry.

Table 2-2 is a sector summary of DoD purchases and is based upon the full 426 industries (see Appendix A). It indicates that DoD is heavily dependent upon the goods-producing sectors of the economy because its purchases are drawn primarily from manufacturing. Over 70 percent of direct purchases, 50 percent of indirect purchases, and 60 percent of total DoD purchases are from manufacturers.

DEFENSE-RELATED EMPLOYMENT IN 1991

Estimates of defense-related employment by industry grouping are shown in Table 2-3. LDEIMS estimates that there were 3.2 million private-sector defense-related jobs in 1991. This figure implies that approximately 3.4 percent of all workers on private-sector payrolls produced goods and services for DoD, either directly or indirectly. We divided defense-related jobs by private-sector payroll employment in 1990 to determine the relative significance of DoD's direct and indirect purchases to each industry grouping. The 10 most heavily defense-dependent industry groupings are all in the manufacturing sector of the economy. This finding is reinforced in Table 2-4, which is a summary of defense-related jobs by major employing sector.

TABLE 2-3

* The DEIMS model includes eating/drinking places in the services sector. We followed this convention by shifting eating/drinking places from retail trade to services in the BLS data.

PROJECTED CHANGE IN DEFENSE-RELATED EMPLOYMENT

According to LDEIMS, private-sector defense-related jobs are projected to decline to 2.3 million by 1997. We divided the projected change in jobs by payroll employment to determine the relative impact each industry grouping will face as defense spending is curtailed (see Table 2-5). While the decline in defense-related jobs is projected to be modest in comparison to the economy — slightly more than 1 percent of private-sector payroll employment — the impact varies quite dramatically among industry groupings. "Missiles, tanks and ordnance" suffer the largest relative decline while "Miscellaneous services" are impacted almost imperceptibly. The 10 most heavily impacted industry groupings are all in manufacturing. This finding is reiterated in Table 2-6, which is a summary of defense-related job losses by major employing sector.

TABLE 2-5*Change in Defense-Related Employment by Industry Grouping: 1991 to 1997*

^a The DEIMS model includes eating/drinking places in the services sector. We followed this convention by shifting eating/drinking places from retail trade to services in the BLS data.

CHAPTER 3

State Analysis

As shown in Table 3-1, DoD's direct and indirect purchases are highly concentrated geographically. The top 10 states account for nearly 60 percent of DoD's purchases of goods and services from the private sector.

TABLE 3-1
Estimated 1991 DoD Purchases by State

State	Direct purchases (1993 \$M)	Indirect purchases (1993 \$M)	DoD total purchases (1993 \$M)	Percent of DoD total	Cumulative percentage	Rank
California	38,848	24,513	63,361	18.5	18.5	1
Texas	10,549	12,115	22,664	6.6	25.1	2

We divided a state's defense-related jobs by total nonfarm private-sector payroll employment in 1991 to determine the relative significance of DoD's direct and indirect purchases. Because DoD civilian and uniformed military employees were not included in this analysis, we intentionally excluded governmental workers from each state's tally. As shown in Table 3-2, dependence of nonfarm private-sector payroll employment on defense spending varies markedly among states from a high of 8.3 percent in Connecticut to a low of 1.4 percent in Nevada.

TABLE 3-2
Estimated 1991 Defense-Related Employment by State

State	Defense-related employment	Total nonfarm, private-sector payroll employment	Defense-related ÷ total (percent)	Rank
Connecticut	112,531	1,348,500	8.3	1
Virginia	165,942	2,250,000	7.4	2

Table 3-3 shows the states that are projected to lose the most defense-related jobs from 1991 to 1997. We divided the projected change in defense-related jobs by total nonfarm private-sector payroll employment to determine the relative impact each state economy will face as defense spending is curtailed. While the overall decline in jobs is projected to be modest - 1.1 percent of the national total - the impact varies quite dramatically among states. Connecticut faces the most severe impact while defense-related employment in Nevada falls negligibly.

CHAPTER 4

County Analysis

DEFENSE CONTRACT ACTION DATA SYSTEM

To identify the impact of defense purchases at locations within states, we performed an analysis based upon the Defense Contract Action Data System. This DoD information system – more commonly referred to as the DD Form 350 data base – captures data about the prime contracts that DoD awards to about 35,000 to 40,000 individual defense suppliers annually.

For prime contract actions greater than \$25,000, the DD Form 350 data base captures the dollar amount of the award, the product or service purchased, and the place of performance among other data that are reported. Because the DD Form 350 data base provides data on DoD purchases of goods and services at levels lower than state, it offers a way to explore the dependence on DoD purchases and potential exposure to reduced defense spending at the county level.¹

The DD Form 350 data base has limitations. It covers prime contract awards; it does not provide any information on the value and distribution of subcontract awards. Usually 40 to 60 percent of the value of a prime contract award is distributed to subcontractors. To the extent that the subcontractors are in locations different from the prime contractor's place of performance, the DD Form 350 data base will overstate the concentration, and hence the impact, of defense spending in states or counties that primarily receive prime contract awards. Additionally, an analysis of macroeconomic impacts should measure the value of goods and services actually produced in any given year. The prime contract awards reported in the DD Form 350 data base are not equivalent to yearly defense purchases because a contract may be performed over more than 1 year. Finally, the DD Form 350 data base provides historical information only and does not have a mechanism for

¹For an alternative method which explores the effects of reduced defense purchases, lower employment of DoD civilian and military workers, and induced effects, see Annex H to the report of the Defense Conversion Commission, *Adjusting to the Drawdown*.

projecting the magnitude, industry composition, or geographical distribution of future defense prime contract awards.

The data that we used to generate the summary reports in this chapter of the report represent only a small amount of the total information available in DoD's more comprehensive DD Form 350 data base. The data records and elements that we extracted identify prime contract award actions that occurred in FY91, were valued at \$25,000 or more, and were assigned to the 50 states and the District of Columbia.

1991 CONTRACT AWARDS

For FY91, our data show 250,212 domestic actions valued collectively at \$122.9 billion (measured in 1991 dollars). An additional \$11.3 billion was spent through actions that were valued at less than \$25,000 and \$12.6 billion was either not assigned to a specific state or was spent outside the United States, yielding \$146.8 billion in total awards in FY91.²

The tables in this chapter display data on the product or service being acquired, the contract value, and the contractor's place of performance (state and county). The DD Form 350 data base uses a product service code (PSC) to identify what is being purchased. We developed a crosswalk between PSCs and standard industrial classifications (SICs) (using the older 1972 classification system) so that the DD Form 350 data could be compared to the DEIMS results.

DD FORM 350 DATA BASE COMPARED TO DEIMS

The data in the DD Form 350 data base are most comparable to DEIMS direct defense purchases; in fact, the DEIMS model relies on historical DD Form 350 data to allocate direct purchases to the states.³ In 1991, defense purchases of goods and services from the U.S. private-sector totaled \$130 billion according to the DD Form 350 data base and \$174 billion according to the DEIMS model.⁴ There are several causes

²Total awards may differ slightly in various published sources due to corrections and updating of the DD Form 350 data base by DoD.

³We made this comparison to demonstrate that results from the DEIMS and DD Form 350 data are complementary.

⁴We expressed the value of 1991 defense prime contract awards in 1993 dollars so that they could be compared to the DEIMS estimates.

for the apparent \$44 billion discrepancy. For example, our DD Form 350 data base did not include actions valued at less than \$25,000 and awards that were not allocated to an individual state. Additionally, the DD Form 350 data base records defense prime contract awards and the DEIMS model estimates defense spending outlays. During a period of declining budgets, awards will decline faster than outlays, so the DD Form 350 data base total in 1991 should be somewhat lower than the DEIMS total. A final significant difference is that the DD Form 350 data base does not report prime contracts for classified (or "special access") programs, while the DEIMS model incorporates spending for these programs into its industry projections.

MAJOR FINDINGS

Our analysis of the DD Form 350 data supports the DEIMS analysis in Chapters 2 and 3 and reinforces our findings that the economic impacts of defense downsizing are likely to be concentrated in a small number of industry sectors and states. Our DD Form 350 data base analysis also shows that the economic impact of defense purchases is concentrated in relatively few counties.

The DEIMS analysis showed a high concentration of defense purchases in some industry sectors; our analysis of defense prime contract awards also shows a high concentration by SIC. Table 4-1 shows the top 20 industries (by SIC code) with the largest dollar value of prime contract awards in 1991. These 20 industries account for 77 percent of the value of the prime contract awards in the 1991 DD Form 350 data base. The aerospace industry (SICs 3721, 3724, 3728, and 3761) accounts for 31 percent of the dollar value of the prime contract awards. The service industry SICs in Table 4-1 account for 15 percent, and the construction SICs represent an additional 5 percent. Appendix B provides a complete listing of 1991 defense prime contract awards by SIC.

The DEIMS analysis showed that DoD depends upon relatively few states for the goods and services that it purchases from the private sector and that relatively few states in turn depend upon DoD. Table 4-2 compares a ranking of states by the absolute magnitude of prime contract awards received in FY91 with a ranking of states by the DEIMS estimates of direct DoD purchases made in CY91. We observe that the state rankings are similar across the two sets of data. Appendix C provides detailed information on the quantity and value of 1991 defense prime contract awards by state.

Table 4-3 compares the relative importance of defense purchases to the states based upon the DD Form 350 data and DEIMS employment estimates. The DD Form 350 data ranking is based upon the ratio of the value of defense prime contract awards received relative to the income earned from all sources by a state's residents in 1991. The DEIMS ranking is based upon the ratio of defense-related jobs to each state's nonfarm private-sector employment in 1991. While the two sets of rankings are similar, the match is not nearly as close as was observed in Table 4-2. This phenomenon occurs because some of the economic impact of a prime contract award "leaks out" as a result of purchases from subcontractors who are located in other states. Consequently, the DD Form 350 data base generally overstates the economic impact of DoD purchases to states that receive large prime contract awards and understates the relative importance of defense purchases to states that perform significant subcontracted defense work.

TABLE 4-3

Based upon our analysis of the DD Form 350 data, we find that defense prime contract awards are concentrated in a relatively small number of counties. Figure 4-1 displays the cumulative percentage of total award value as a function of the number of counties receiving awards. The 2,103 counties that received at least one prime contract award over \$25,000 in 1991 were ranked in descending order of total value of awards received. The initial steepness of the curve indicates that the value of prime contract awards is highly concentrated with a small number of counties accounting for the major portion of awards. Table 4-4 lists the top 20 counties ranked by highest dollar value of awards. California is heavily represented with 4 of the top 20 counties. Collectively, these four California counties account for 15 percent of the value of the prime contract awards in the 1991 DD Form 350 data base. Other states with a heavy dependence upon DoD purchases include Connecticut with 3 of the top 20 counties (accounting for 3.9 percent of prime contract awards), Texas with 2 (4.9 percent), Massachusetts with 2 (4.8 percent), and Arizona with 2 (1.8 percent). Appendix D is a complete listing of the value of 1991 defense prime contract awards by county.

CHAPTER 5

Occupational Analysis

METHODOLOGY

We estimated the occupational composition of private-sector defense-related employment and the occupational composition of defense-related job losses likely to occur between 1991 and 1997.¹ Building upon previous results from our analysis, the private-sector economy was disaggregated into nine sectors, and employment was disaggregated into nine occupations. Initially, we assumed that defense-related employment in each of the nine sectors mirrored non-defense-related employment. Based upon our knowledge of the types of products purchased by DoD, this assumption was tenuous for the manufacturing sector.

Using the BLS industry-occupation matrix for 1990, we tested whether the occupational composition of defense manufacturing was similar to that of the manufacturing work force as a whole. We found that the industry-occupation coefficients for three low-technology industries (i.e., ordnance, ships/boats, and automobiles) were quite similar to the coefficients for manufacturing (and particularly for durable manufacturing). However, the coefficients for five high-technology industries (i.e., missiles, search/navigation equipment, aircraft, communication equipment, and computers) were very different from the manufacturing sector as a whole. Because defense expenditures in high-technology industries are large, our assumption about the occupational composition of the defense manufacturing work force was modified.

In the aggregate, the eight low- and high-technology industries we examined in detail account for a large share of defense-related employment in the manufacturing sector (957,550 out of 1,656,777 jobs, or 57.8 percent). Therefore, it was plausible to use an

¹For other analyses of the employment effects of reduced defense spending, see Norman C. Saunders, "Defense Spending in the 1990s – The Effect of Deeper Cuts," *Monthly Labor Review*, October 1990, pp. 3–15 and Douglas J. Braddock, "Scientific and Technical Employment, 1990–2005," *Monthly Labor Review*, February 1992, pp. 28–41.

employment-weighted average of the industry-occupation coefficients for these eight industries as a proxy for the defense manufacturing sector. We relied upon the BLS industry-occupation matrix for the coefficients of the remaining eight nonmanufacturing sectors.

As shown in Table 5-1, each sector has a unique pattern of occupations characterizing its workers. For example, 24.5 percent of the jobs in defense manufacturing are in the "Precision production, craft, and repair" category and 18.4 percent are "Operators, fabricators, and laborers." In contrast, 4.1 percent of the jobs in services are in the "Precision production, craft, and repair" category and 4.9 percent are "Operators, fabricators, and laborers."

FINDINGS

Using the industry-occupation coefficients from Table 5-1, the DEIMS employment estimates for 1991 were disaggregated by occupation. As shown in Table 5-2, of approximately 3.2 million private-sector defense-related jobs, 378,433 are categorized as "Executive, administrative, and managerial," 604,951 as "Professional specialty" (predominately engineers and scientists), 205,122 as "Technicians support," and 597,256 as "Precision production, craft, and repair."

The occupational composition of private-sector defense-related jobs can be contrasted with the private sector as a whole. Comparing the line entitled "Composition" in Table 5-2 with the "Private sector" line in Table 5-1, we observe that private-sector defense-related jobs are over-represented in the "Executive, administrative, and managerial," "Professional specialty," "Technicians/support," and "Precision production, crafts, and repair" categories and are under-represented in the "Marketing and sales," "Service occupations," and "Agriculture, forestry, and fishing" categories. This result is mirrored in the last row in Table 5-2, which shows the proportion of private-sector defense-related jobs in each occupational category. While DoD purchases generate 3.4 percent of total private-sector payroll employment, DoD has an above-average share of "Executive," "Professional," "Technicians," and "Precision production" jobs and a below-average share of "Marketing," "Service," and "Agriculture" jobs.

Parallel techniques can be used to estimate occupational defense-related job losses. As shown in Table 5-3, of the nearly 1 million defense-related jobs that DEIMS estimates will be lost between 1991 and 1997, 116,171 are "Executive," 176,885 are "Professional," 64,604 are "Technicians," 193,439 are "Precision production," and 165,225 are

F

“Operators.” The row in Table 5-3 entitled “Defense jobs lost relative to private sector” demonstrates that while defense downsizing will eliminate approximately 1 percent of total private-sector payroll employment, those five occupations will absorb above-average reductions.

Because industries that produce goods and services for DoD employ relatively large proportions of people in these five occupations, defense workers who lose their jobs may have some difficulty finding reemployment. Those who lose “Executive,” “Professional specialty,” and “Technicians” jobs may have a relatively less difficult time because employment in these three occupations is expected by the BLS to increase between 1990 and 2005 by 27.4 percent, 32.3 percent, and 36.9 percent, respectively. Conversely, those who lose “Precision production” and “Operators” jobs may have a significantly more difficult time because employment in these two occupations is projected by the BLS to increase during the same time frame by only 12.6 percent and 4.2 percent, respectively.²

²George Silvestri and John Lakasiewicz, “Occupational employment projections,” *Outlook: 1990–2005* (BLS Bulletin 2402), May 1992, pp. 62–65.

Reproduced by NTIS

National Technical Information Service
Springfield, VA 22161

NTIS does not permit return of items for credit or refund. A replacement will be provided if an error is made in filling your order, if the item was received in damaged condition, or if the item is defective.

This report was printed specifically for your order from nearly 3 million titles available in our collection.

For economy and efficiency, NTIS does not maintain stock of its vast collection of technical reports. Rather, most documents are printed for each order. Documents that are not in electronic format are reproduced from master archival copies and are the best possible reproductions available. If you have any questions concerning this document or any order you have placed with NTIS, please call our Customer Service Department at (703) 487-4660.

About NTIS

NTIS collects scientific, technical, engineering, and business related information — then organizes, maintains, and disseminates that information in a variety of formats — from microfiche to online services. The NTIS collection of nearly 3 million titles includes reports describing research conducted or sponsored by federal agencies and their contractors; statistical and business information; U.S. military publications; audiovisual products; computer software and electronic databases developed by federal agencies; training tools; and technical reports prepared by research organizations worldwide. Approximately 100,000 new titles are added and indexed into the NTIS collection annually.

For more information about NTIS products and services, call NTIS at (703) 487-4650 and request the free *NTIS Catalog of Products and Services*, PR-827LPG, or visit the NTIS Web site
<http://www.ntis.gov>.
